SuppleCare Project Listing

Ready-to-enter content for the ICT Center Projects form

Project details

Project Title	SuppleCare - Supplement Schedule and Wellness Tracker
Category	Suggested: Web Application / Health Technology (select the closest available category)
Short Excerpt	A bilingual supplement schedule and wellness tracker with reminders, meal planning, health check-ins, and progress insights.
Build Duration	Not stated in the repository. Enter the actual project duration.
Status	Draft until public demo links, screenshots, and project details are reviewed.
Featured	Off unless the project owner wants it highlighted.
Featured Label	Leave blank unless featured; optional label: Featured Project.

Project overview

SuppleCare is a web application that helps people organize their daily supplement routines and related wellness habits. Users can build a schedule, mark doses as taken, receive reminders, plan meals for the week, record daily health check-ins, and review adherence over time. The interface supports English and Khmer. A separate administrator area manages user accounts, the supplement catalog, spacing rules, starter meal plans, and administrator accounts.

Problem statement

People who take several supplements may have difficulty remembering doses, keeping a consistent routine, and tracking whether they followed their schedule. Product information and timing guidance can also be scattered across labels and personal notes. SuppleCare brings the schedule, reminders, meal planning, check-ins, and progress history together in one place, while allowing administrators to maintain the catalog and timing rules.

Challenges and solutions

Challenges	Keeping daily routines easy to follow; identifying potentially close supplement timings; supporting English and Khmer; separating user and administrator access; handling reminders across time zones; and making photo-based AI suggestions reviewable before they affect a schedule.
Solutions	A daily dose timeline with one-tap tracking; configurable spacing rules and schedule warnings; localized user pages; separate web and admin guards; user-local date and time handling; and an AI photo scan flow that returns a proposed plan for user review before application.

Technologies used

Laravel 12 | PHP 8.2+ | Blade | MySQL | Bootstrap 5 | Vite | JavaScript | AJAX | Chart.js | Flatpickr | DataTables | Select2 | SweetAlert2 | Laravel Socialite | Telegram Bot API | Anthropic Claude API

Objectives

- Help users create and maintain a clear daily supplement schedule.
- Make dose tracking and reminders convenient across web, email, browser, and Telegram options.

- Provide meal planning, daily health check-ins, and adherence summaries alongside supplement routines.
- Support English and Khmer for user-facing pages.
- Give administrators tools to manage users, catalog entries, spacing rules, meal templates, and admin accounts.
- Allow users to scan supplement label photos and review an AI-generated schedule before applying it.

Development process

1. Requirements and structure	Mapped user and administrator workflows, authentication, routes, data models, and supported languages.
2. Core application	Built schedule management, daily dose tracking, meal plans, health logs, calendar, profile, and progress features.
3. Safety and administration	Added catalog management, configurable spacing rules, separate admin access, and user account controls.
4. Integrations	Added optional Google sign-in, scheduled reminders, Telegram reminders, and AI-assisted label scanning.
5. Review and deployment	Use the project test suite and deployment configuration before publishing. Confirm public demo, repository, and documentation links before setting the listing live.

Links and media

Live Demo URL	Not provided. The local development address is http://supplecare.test and is not a public demo link.
GitHub URL	Not provided. Add the public repository URL if one is available.
Documentation URL	Not provided. Add a public documentation URL if available. The repository README is the current setup guide.
Thumbnail	Upload a clean 8:5 crop of the actual application, ideally the dashboard or daily schedule screen.
Cover Image	Upload a 21:9 crop of the actual application or a project overview graphic.
Screenshots Gallery	Recommended: dashboard/today view, supplement schedule, meal plan, progress chart, and administrator dashboard. Use real app screenshots and remove personal or test-account data.

Search metadata

Meta Title	SuppleCare | Supplement Schedule and Wellness Tracker
Meta Description	SuppleCare helps users organize supplement schedules, reminders, meal plans, health check-ins, and adherence tracking in English and Khmer.

Project links for internal reference

These local routes are useful while preparing screenshots and a demo. They require the local Laravel app to be running and are not public URLs:

- http://supplecare.test/ - landing page
- http://supplecare.test/dashboard - today and dose tracking (signed-in user)
- http://supplecare.test/supplements - supplement schedule (signed-in user)

- http://supplecare.test/meals - meal plan (signed-in user)
- http://supplecare.test/progress - adherence insights (signed-in user)
- http://supplecare.test/admin/login - administrator sign-in

Before publishing

Replace the missing public URLs with verified links, choose a category that exists in the form, enter the real build duration, and upload screenshots from the running application. Do not publish the local .test address as a public demo.
